## Negotiating Group on Market Access

### SIMULATION OF TARIFF REDUCTIONS FOR NON-AGRICULTURAL PRODUCTS

#### Note by the Secretariat

At the request of Chairman of Negotiating Group on Market Access, the Secretariat has undertaken a simulation exercise, which takes into account a Swiss formula with various coefficients, paragraph 8 flexibilities and treatments of unbound tariffs. The specific parameters used in this simulation exercise are identical to the ones used in the simulation undertaken by ten Members (see Job(06)/57). The assumptions and indicators used, as well as the summary statistics provided in this simulation, are without prejudice to the rights and obligations and positions of Members in the NAMA negotiations.

Annex 1 describes the methodology used and assumptions made in the simulation, as well as some guidance to interpret the results. Annex 2 describes, for each Member, the data problems encountered and how they were solved. Annex 3 explains the various statistical indicators used in the results tables. Annex 4 presents the simulation results by Member in an aggregated form. All results of the simulations, both at tariff line level and HS Chapter level, are included in a CD-ROM, which has been made available to Members.

## ANNEX 1 TECHNICAL NOTES

### 1. Members included in the simulation exercise

The simulation exercise has been undertaken for all Members except for those that are currently covered by Paragraph 6 (i.e. developing countries with a binding coverage below 35 per cent) or Paragraph 9 (least-developed countries), which are exempt from the application of the formula. The ten Members that participated in the earlier simulation exercise (Job(06)/57) have also been included for the sake of comparison and because a different and more exhaustive set of summary statistics has been provided in this simulation.

### 2. Preparation of the dataset

The simulations were undertaken on the basis of a consolidated dataset for each Member, which contained the following information at tariff line level:

- 1) final bound duties;
- 2) 2001 applied duties (used for unbound tariff lines);
- 3) 1999-2001 import values;
- 4) 2005 applied duties.

The Secretariat used some datasets that were prepared by Members without carrying out any specific verification of either their bound or applied tariff data. This concerns the ten Members<sup>1</sup> that prepared their information for the simulation presented in Job(06)/57, as well those other Members that provided information to the Secretariat for their own simulations. The specific data sources have been indicated in Annex 2. For the remaining Members, the Secretariat established the datasets based on data from the IDB, CTS, and CAMAD databases.<sup>2</sup>

The following paragraphs describe the main technical issues that the Secretariat had to take into account, as well as how these data were processed and consolidated to construct a common dataset for each Member. Several general assumptions were made in order to link data from the different sources. Moreover, for some Members, it was necessary to take special steps in order to bridge the data gaps or to correct other data problems. These Member-specific treatments are described in Annex 2.

#### (a) 2001 MFN applied duties and final bound duties

The Secretariat's project to link MFN applied duties and import data from the IDB with the bound duties from the CTS provided a solid basis for the simulation exercise.<sup>3</sup> Linked IDB files were converted to datasets containing applied duties and imports values of 2001, as well as the final bound duties. The link refers, for some Members, to the year 2000.

#### (b) Import values of 1999 to 2001

The Secretariat identified a number of cases in which the Members' tariff data are at a more detailed level than the imports. It is not possible in these cases to make an exact correlation between the two. Therefore, the Secretariat preserved the tariff line suffix (TLS) breakouts and distributed evenly the import value across all TLS breakout lines.

---

<sup>1</sup> Australia, Brazil, Canada, European Communities, Egypt, India, Japan, Malaysia, Norway and the United States

<sup>2</sup> CAMAD, is a joint ITC/UNCTAD/WTO databases which pools the trade and tariff information of the participating organisations.(see JOB(04)/179)

<sup>3</sup> See Document G/MA/156 on the methodology for linking IDB and CTS data files.

Similarly, since the tariff line codes of 1999 and 2000 do not necessarily match those of 2001 for many Members, special steps were taken to consolidate these data to the base datasets, which are normally based on Members' 2001 schedules. All the import values of 1999 and 2000 under a particular HS 6-digit subheading were added up, and that sum of values was redistributed amongst the 2001 tariff codes under that subheading according to the 2001 import value structure. Using this methodology, the Secretariat transposed all 1999 and 2000 imports into the corresponding 2001 tariff codes.

(c) 2005 MFN applied tariffs or latest applied tariffs

Whenever available, the Secretariat included in the dataset Members' 2005 MFN applied tariffs. These were sourced either from the IDB or from CAMAD. For Members for which the 2005 applied duties were not available, either 2006 or earlier MFN applied duties were sourced from the IDB instead. For the sake of simplicity, in the subsequent methodological explanations, reference is made only to the 2005 applied tariffs.

Since 2005 MFN applied duties are normally in the HS2002 nomenclature, they had to be transposed to the HS1996 nomenclature in order to match the bound duties and imports. These transpositions were conducted based on the WCO standard correlation table at HS 6-digit subheading level using the following process:

- 1) calculate the average of 2005 MFN duties for each HS2002 6-digit subheading;
- 2) apply a concordance table at the HS 6-digit level and find all corresponding HS2002 subheading averages for each HS1996 subheading;
- 3) for each HS1996 subheading, take the average of all corresponding HS2002 subheading averages;
- 4) use the average of HS96 subheadings as the 2005 applied duty for each tariff line in the base datasets.

(d) *Ad valorem* equivalents (AVEs)

The Secretariat included in the dataset the AVEs for non *ad valorem* bound tariffs, as calculated by the Member concerned or by the Secretariat on behalf of Members based on the AVE methodology agreed in Secretariat document Job(05)/166/Rev.1. However, some difficulties were encountered when merging AVE data with the CTS files. For instance, some Members calculated the AVEs based on the breakout of their applied schedules and, therefore, the tariff codes in the AVE submissions did not match those of their bound duties. In other cases, the calculations resulted in more than one AVE for one bound tariff line, because the structure of the applied duties had a more detailed structure than the structure of the bound ones.

AVEs for 2005 MFN applied tariff were only available for one Member in the IDB. Whenever AVEs were not available or could not be used in the simulation, the duties were recorded as missing and excluded from the calculation of the summary statistics.

(e) Product coverage

The Secretariat based the product coverage of non-agricultural products on the WTO Secretariat's working definition in the HS96 nomenclature, as contained in Annex 3 of Job(05)/32.

## (f) Unbound items

For Members having linked IDB files, the Secretariat was able to identify the unbound items at tariff line level. However, it was difficult to identify the unbound tariff lines for those Members without a linked IDB file. In these cases, only those HS 6-digit subheadings having no bound tariff lines whatsoever were treated as unbound items. It is therefore possible that some partially unbound tariff lines have not been included in the analysis for some Members. For these tariff lines, only the existing bound duties have been used in their respective subheadings.

## (g) Schedules in HS2002

The Schedules of Saudi Arabia, Former Yugoslav Republic of Macedonia and Pakistan are currently coded in HS2002 nomenclature in the CTS.<sup>4</sup> The simulation was undertaken in HS2002 nomenclature without taking into account imports since these were not available for these three Members.

### 3. Simulation methodology

The tariff reductions were simulated using a Swiss formula with various alternative coefficients, paragraph 8 flexibilities and markups for unbound tariff lines. For each tariff line, a new bound tariff and a new applied tariff was calculated by applying a Swiss formula with four coefficients for developed Members and six coefficients for developing Members, as well as two ABI<sup>5</sup> coefficients for both developing and developed Members. All these calculations were done for two constant mark-ups and two types of Paragraph 8 flexibilities for developing Members. Therefore, for Members with unbound tariff lines, there are 12 scenarios for developed Members and 48 scenarios for developing Members. For Members whose schedules are fully bound, only six and 24 scenarios were done for developed and developing Members, respectively.<sup>6</sup>

## (a) Coefficients

For developed Members, the following coefficients were used:

- Swiss formula: A= 2, 5, 10, 15
- ABI formula: B=1, 3

For developing Members:

- Swiss formula A= 15, 20, 25, 30, 35, 40
- ABI formula: B=1, 3

## (b) Unbound mark-up

The unbound mark-up was applied to the 2001 applied tariff *ad valorem* duty or AVE for all unbound tariff lines. The simulations used the following two non-linear mark-up values for each coefficient.

- + 5 percentage points

---

<sup>4</sup> In the case of Pakistan, there was an extension of the binding coverage which has been certified in the HS2002 nomenclature (See WT/Let/502). Since this extension covered most of their tariff schedule, it was decided to convert the whole file to the HS 2002 nomenclature. This new file is not yet available in the CTS Database and will be submitted for multilateral review in June 2006.

<sup>5</sup> ABI refers to a proposal made by Argentina, Brazil and India in document TN/MA/W/54. It should be noted that the proposed formula is a variation of the Swiss formula where the coefficient for each Member is defined as  $A = B \times T_a$ , where  $T_a$  refers to, each Member's bound tariff average and B is a multiplication factor. The tariff average was calculated by taking the line-by-line average of all bound tariffs (excluding unbound tariff lines),

<sup>6</sup> The classification of Members as developed or developing is done without prejudice to the position of the Members concerned.

+ 30 percentage points

(c) Paragraph 8 flexibilities

The Secretariat simulated for each developing Member the effects of both Paragraph 8(a) (less than formula cuts) and 8(b) (exceptions from binding or the application of formula cuts), as well as the no application of any of these two options, under each of the coefficients. Furthermore, the bracketed numbers shown in paragraph 8 were used as such.<sup>7</sup> The specific tariff lines for each of the options were selected as follows:

- 1) No flexibility: the formula was applied to all tariff lines, without exception.
- 2) Paragraph 8(a) flexibility: less than formula cuts (defined as 50 % of the full formula cut) were applied to a set of tariff lines that were less than 10% of NAMA tariff lines and their imports were less than 10% of NAMA imports. These tariff lines were selected one-by-one in descending order of (1) highest 2005 MFN applied tariff, (2) highest base duties and (3) lowest import values. Tariff lines were selected until either the condition of 10% of NAMA tariff lines or 10% NAMA import values was reached.
- 3) Paragraph 8(b) flexibility: no formula cuts were applied to a set of tariff lines which were less than 5% of total NAMA tariff lines and total import value were less than 5% of NAMA imports. Tariff lines were selected following the same logic as above. Tariff lines were selected until either the condition of 5% of NAMA tariff lines or 5% NAMA import values were reached.

(d) New MFN applied duties

The potential new MFN applied duties that could result from the application of the different scenarios were simulated based on the 2005 MFN applied duties. If the new bound duties were lower than the 2005 MFN applied duties, the new MFN applied duties were adjusted to be equal to the new bound duties. Otherwise the original 2005 MFN applied duties were retained.

#### 4. Presentation of simulation results

The summary statistics of simulations are presented at three levels: Member level, HS chapter level and tariff line level. The results by Member are included in Annex 4, which shows the impact of tariff reductions on NAMA products at the most aggregated level for each Member. The simulation results at tariff line level and summary statistics by HS Chapter for each Member are included in a CD-ROM, which can be used by Members themselves to do further analysis.

The following caveats should be taken into account in the analysis of the results:

- 1) **Selection of flexibilities**: The selection of flexibilities is a "best guess" based on clearly established criteria but Members are likely to deviate from the Secretariat list. Nevertheless it may serve as a reasonable starting point for assessing the potential impact of the different assumptions. It should be noted that in the Secretariat simulation, the import constraint is not reached in most cases because the tariff lines with low imports were included on a priority basis for given base and applied duties.
- 2) **Effects on 2005 applied duties**: The estimation of the effects on the 2005 applied duties cannot be 100% accurate in the absence of detailed tariff line concordance tables. For Members that provided their own simulation files based on tariff line concordance tables, the results can be considered fully accurate to the extent that their concordance is accurate. In all other cases, the transposition of applied tariffs in HS 2002 nomenclature to HS 1996

---

<sup>7</sup> The condition that no entire HS chapter should be covered by flexibilities has not been taken into account in the simulation because the exclusions of one or several tariff lines would have been arbitrary and would most likely not reflect the final selection of the concerned Member.

- nomenclature as described in section 2(c) would normally lead to some loss of precision. The level of precision of this methodology depends on the level of tariff dispersion at the level of HS subheadings. That is, a completely "flat" tariff would suffer no loss of precision, whereas a tariff schedule with very different duties at the level of national tariff lines would lose some precision because of the averaging to HS 6-digit level.
- 3) **Reductions of bound duties:** Reductions of bound duties have been calculated as reduction of new bound duties compared to the base duties. One can observe that the inclusion of marked-up unbound tariff lines yields higher bound rate cuts with higher mark-up values.
  - 4) **Statistics for dutiable lines:** Many Members have a considerable number of duty-free tariff lines, the inclusion of which could lead to an underestimation of the tariff reductions. Therefore, statistics for dutiable tariff lines are included to supplement statistics for all tariff lines.
  - 5) **Partially bound subheadings:** As mentioned above, some partially bound subheadings were treated as fully bound. This could potentially overestimate the binding coverage for these Members and, also in addition, slightly reduce the precision of the simulation results.
  - 6) **Newly acceded Members:** The reduction on MFN applied duties for newly acceded members is overestimated to the extent that some of their final bound duties have not yet been fully implemented by 2005;
  - 7) **Non-*ad valorem* duties:** The reduction on MFN applied duties may not be precise for some Members with non-*ad valorem* duties because the AVEs for their 2005 MFN applied duties are not available. These non-*ad valorem* duties are ignored in the calculation;
